

IT Security & Compliance Standards

Section 1: Password and Access Controls

Access to company networks, ERP databases, and servers is restricted to authorized personnel.

Passwords must be at least 12 characters long and contain uppercase, lowercase, numbers, and special symbols.

Passwords must be updated every 90 days. Sharing passwords or access badges is strictly prohibited. Employees must lock their computer screens (Windows key + L) whenever they step away from their desk.

Section 2: Device and Asset Security

Company-provided laptops, tablets, and mobile phones are business assets. Personal use should be kept to a minimum. Installing unauthorized software, games, or torrent clients is blocked by security.

Connecting unauthorized external media (USB drives, external hard disks) to company computers is prohibited to prevent malware injection. All company devices run mandatory antivirus software.

Section 3: Data Protection and Privacy

Customer database entries, employee records, financial reports, and proprietary codes are classified as strictly confidential. Copying, exporting, or emailing confidential files is monitored by DLP systems.

Any request for company data from external third parties must be immediately routed to the legal and compliance team. Breaching confidentiality leads to immediate termination and legal action.

Section 4: Safe Internet and Email Usage

The company network is filtered to block dangerous, offensive, or malicious websites. Using VPNs or proxies to bypass content filters is a violation of security protocols.

Phishing prevention: Do not click links or download attachments from unknown senders. Report suspicious emails using the 'Report Phishing' button on your email client interface.

Section 5: Security Incidents and Reporting

If a laptop is lost, stolen, or compromised, the employee must report it to the IT Security Helpdesk within 2 hours. Remote wipe commands will be issued to protect data.

If you notice suspicious activity on your desktop or database access logs, immediately disconnect from network and call support. Prompt reporting reduces system vulnerability.
